

SOVEREIGN NEXUS: STACK 3 — 12-NODE AGENTIC SWARM & TOOLING

Mixture of Experts (MoE), Neuro-Symbolic Gating, and Sub-18.69MB Heap Control

Architect: David John Niedzwiecki Jr. | Axiom: $1=1=1$ | Heap Ceiling: ≤ 18.69 MB RSS

1. THE 12-NODE MIXTURE OF EXPERTS (MoE) TOPOLOGY

- **Sector Shield (Nodes 01-03):** Metabolic Governor (105°C limit), Enforcer Airlock (prompt sanitation), Sentinel-Gemini (SHA-256 fixity audit).
- **Sector Harvester (Nodes 04-06):** Agentic Walker (BFT traversal), Context Slicer (bounded chunking), MoltBook Sentinel (bounty scout).
- **Sector Crucible (Nodes 07-09):** Truth Vector Mill (AST logic graph), Ternary Engine (GF(3) 5-in-1 packing), Media Forge (Laplacian variance).
- **Sector Keep (Nodes 10-12):** Cartographer (WGU academic moat), Vampire Auditor (semantic deduplication), Perc Ledger (contract settlement).

Active Resident Memory: Pinned to ≤ 18.69 MB RSS via bounded `fetchmany(size=50)` stream generators.

2. STAGE 10: LOBOTOMY PROTOCOL (NEURO-SYMBOLIC HOT-SWAP)

When a known mathematical invariant ($1=1=1$, Pythagorean metric, Merkle chain) is detected, probabilistic neural weights are bypassed and hot-swapped to native symbolic execution in **0.002 ms** (< 15 ms requirement), eliminating hallucination on the metal.

3. LENS 09 ENTROPY SENTINEL & VAMPIRE BAT OPTIMIZATION (VBO)

Computes discrete Shannon Entropy $H(X)$. Payloads with $H(X) > 4.50$ (repetitive synthetic slop) trigger dynamic 0-state filtering ($\Delta \rightarrow 0.45$). VBO applies reciprocal altruism pruning to deduplicate offline context.

4. A-AKG & SQLITE POINTER-INDEXING WITH ZERO-COPY MMAP

Sharded SQLite tables stream directly off the Samsung T7 NVMe SSD via kernel virtual memory address space, maintaining a **0.00 KB RAM heap delta** across all archive reads.
